SYSTEM_INFO.TXT

// IDENTITY

READ-ONLY

adam@os:~\$ whoami

Embedded systems engineer in his final master year, building tiny computers that do smart things. Started with Arduino and sensors, grew into Raspberry Pi servers, AI agents, and full software systems. I teach kids robotics, I lead a scientific club, and I build agentic workflows that replace entire dev teams. My portfolio boots like an operating system because I think software should feel **alive**.

EXECUTABLES

// EXPERIENCE_LOG

4 ENTRIES

2025 — 2026

President

// Scientific Club Afaq — Bouira University

Led the club for two years. Organized the **Race Event Challenge**: a 4-day program where I taught participants with zero electronics background from scratch, then guided them through building **smart robotic cars** controlled by mobile apps via ESP32. Designed the curriculum, ran the workshops, debugged 30+ projects in real time, and shipped the final robotics soccer (Rocket League) challenge.

ESP32

WORKSHOP

ROBOTICS

2024 — 2025

Arduino & Robotics Instructor

// CLS Bouira

Taught kids aged 10–16 the basics of electronics, Arduino programming, and robot construction. Designed the curriculum from scratch — starting from "what is an LED" up to building autonomous line-following cars. The goal was never just the tech; it was teaching them how to think like builders.

TEACHING

ARDUINO

CURRICULUM

2024 — NOW

AI Vibe Coder & Agentic AI Builder

// Independent

Build agentic workflows and agentic AI systems for real use. Shipped a **multi-agent dev workflow** — an architect, planner, debugger, tester, marketer, and content creator working as a single automated team. The system handles front-end, back-end, content, scheduling, and operations for any business, product, or developer. Runs 24/7 on my self-hosted Raspberry Pi server.

RASPBERRY_PI

2025

Full-Stack Builder

// Independent

Built a complete **school management software** over 2 months with Claude + Antigravity — receipts, payment tracking, appointments, event scheduling, sales tracking, finances, reports, timetables, planners. Designed to be useful, not AI slop. Also shipped client web apps with React, Next.js, and Tailwind.

// FILE_SYSTEM

5 ITEMS

SMART_IRRIGATION

AI-predictive plant monitoring system. ESP32 + DHT + soil moisture sensors stream to Firebase; web app shows real-time data; ML model predicts plant type from sensor readings.

ESP32

DHT22

FIREBASE

ML

WEBAPP

RACE_CHALLENGE

4-day workshop + build: smart robotic cars controlled by mobile apps. Line-following optical + Rocket League soccer mode. 30+ participants, zero to working bot.

ESP32

BLUETOOTH

MOTOR_DRV

MOBILE_APP

AGENTIC_DEV_TEAM

Multi-agent dev workflow: architect + planner + debugger + tester + marketer + content creator. Automates front-end, back-end, content, scheduling. Runs 24/7 on Pi.

RPI

SCHOOL_MGMT.exe

Full school management software — receipts, payments, appointments, events, sales, finances, reports, timetables, planner. Built with Claude + Antigravity. 2-month sprint.

REACT

NEXT.JS

TAILWIND

AI-ASSISTED

RPI_SELF_HOST

Self-hosted Linux server on Raspberry Pi — SSH-accessible VPS replacement. Runs my AI agents 24/7 without subscription costs. Hosts side projects, automates cron jobs, serves as my personal cloud.

EDUCATION

Master's in Embedded Systems

Bouira University // 2024 — 2027

Currently in Master 1. Master 2 starts 2026/2027 — graduation on completion. Focus: embedded systems, IoT, hardware-software integration, AI on edge devices.
